

## Graphing Data

Bar graphs and line graphs are great for looking at data over time intervals, or showing the rise and fall of a quantity over the passage of time.

Example:

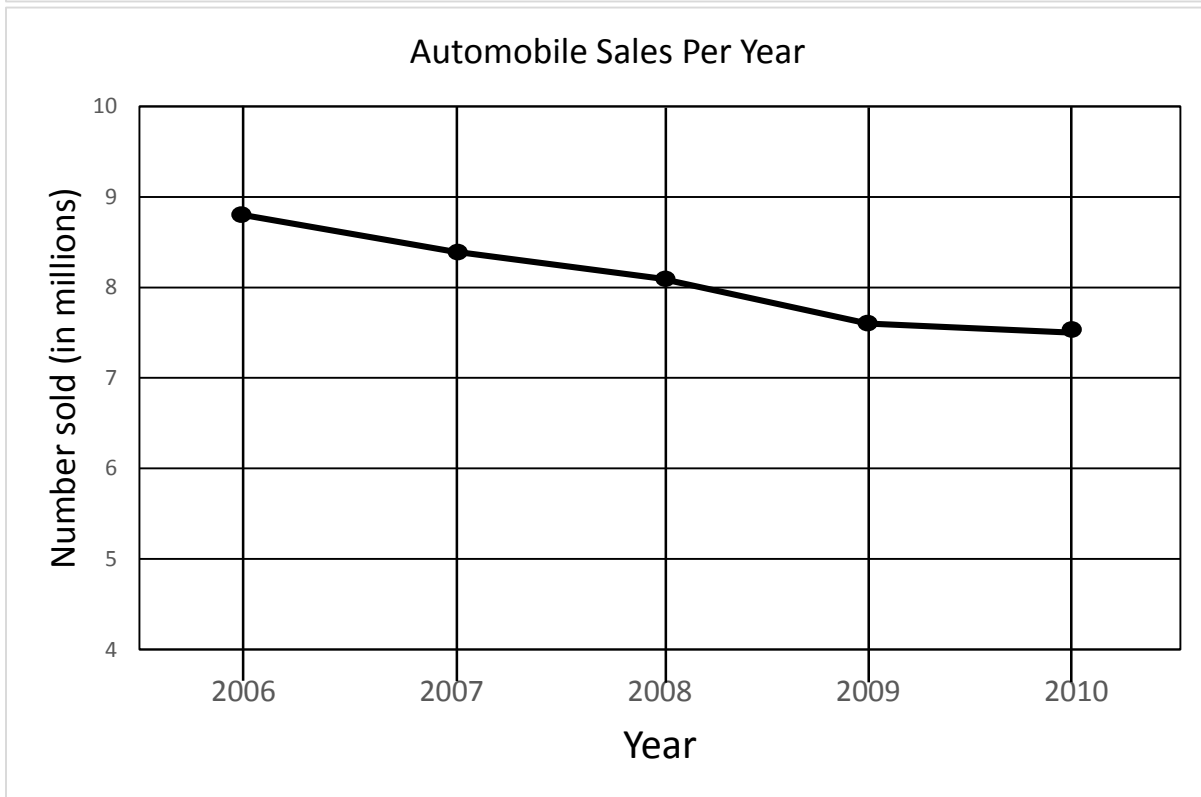

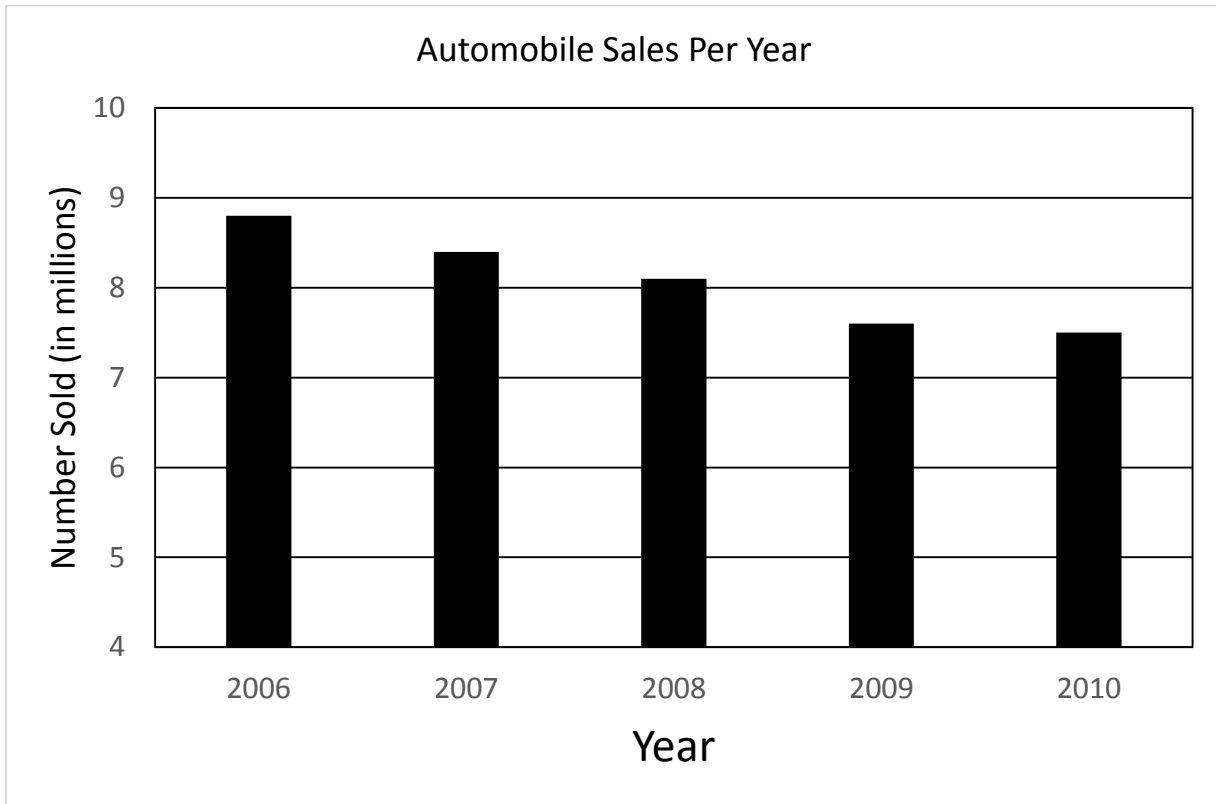

Auto Sales by Year

Year	Number sold (in millions)
2006	8.8
2007	8.4
2008	8.1
2009	7.6
2010	7.5

### Steps for Making a Bar Graph or Line Graph

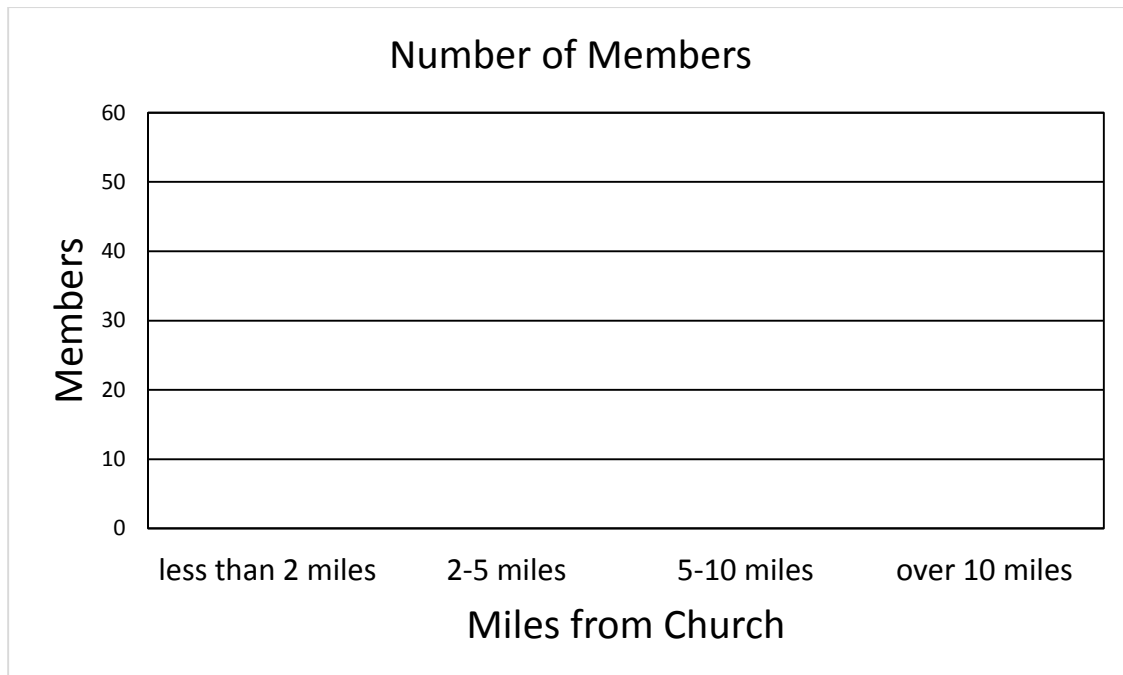

1. Draw and label the horizontal and vertical axes of the graph.
2. Choose a scale to fit the data for each axis and make intervals.
3. Draw a bar for each interval or plot points and connect them.
4. Title the graph.

The data in a bar graph and line graph:

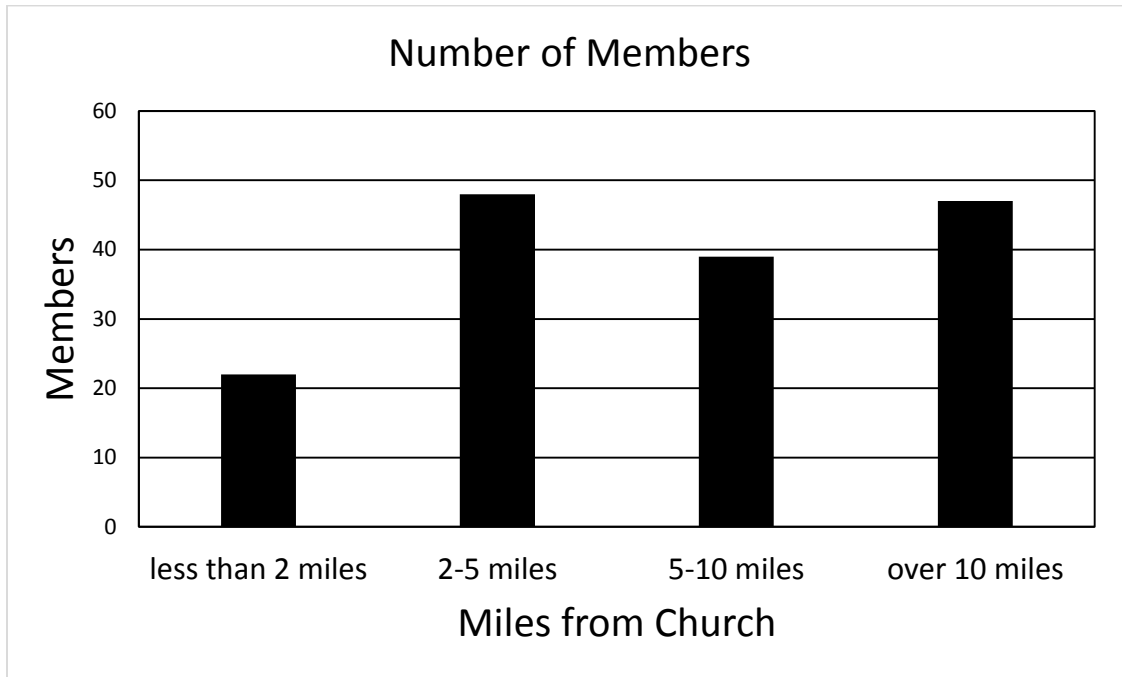

**Sample Problem:** Make a bar graph of the following chart using increments of 10.

Miles from Church	Number of Members
less than 2 miles	22
2-5 miles	48
5-10 miles	39
over 10 miles	47

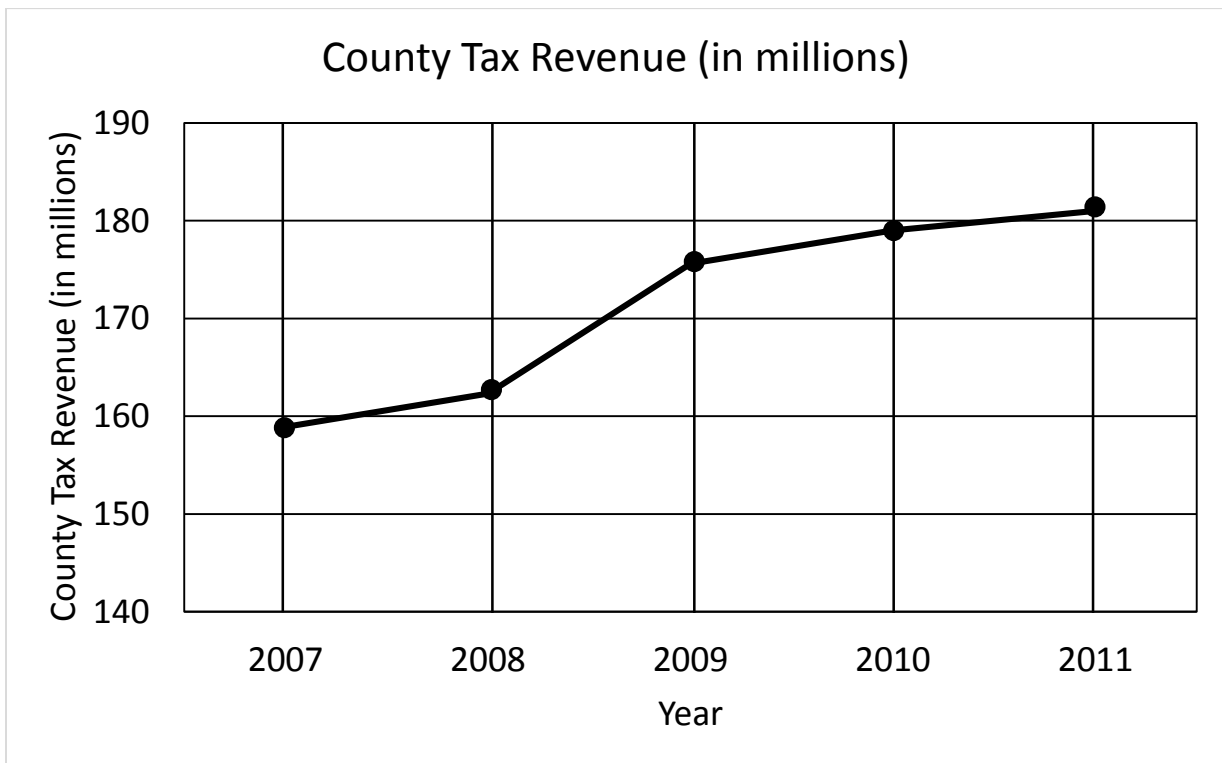

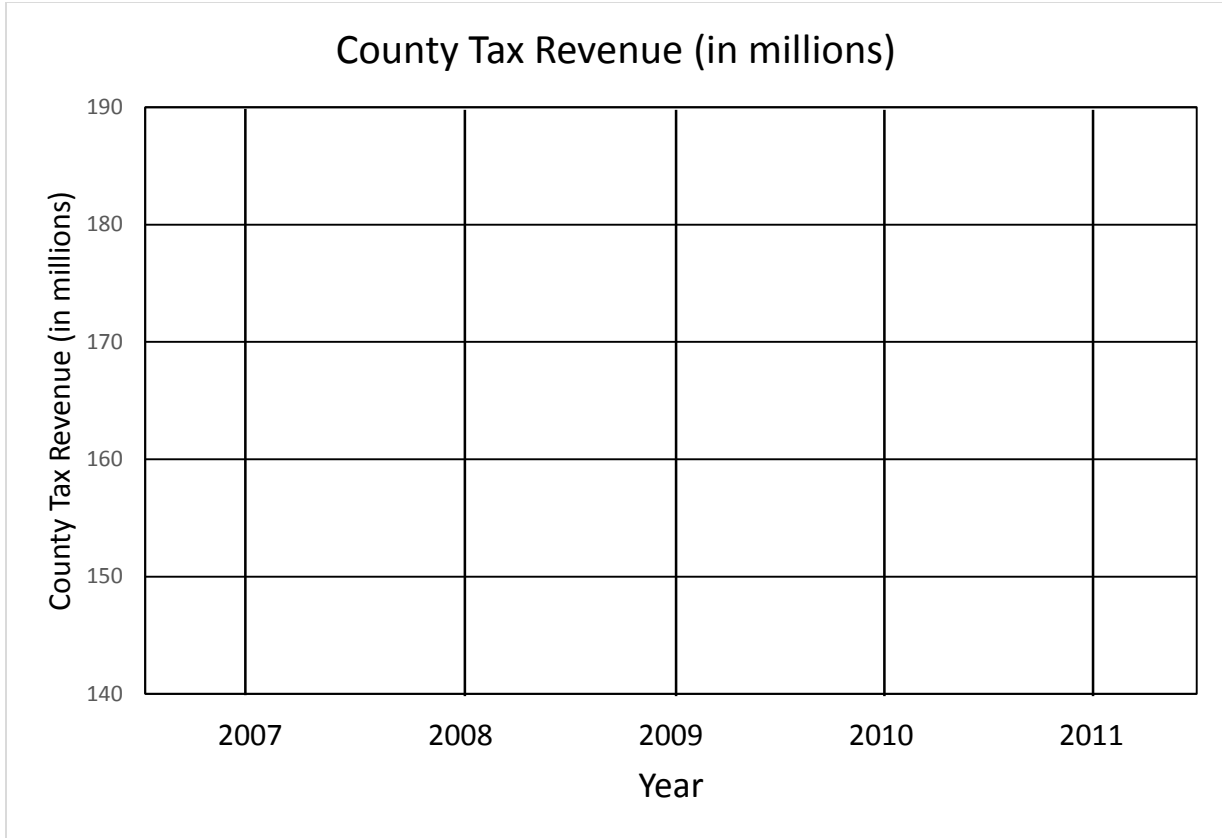

Solution:

**Sample Problem:** Make a line graph of the following chart.

Year	County Tax Revenue (in millions)
2007	158.9
2008	162.3
2009	175.6
2010	179
2011	181

## Circle Graphs

**Consider the following example:** Last year in CHAT we had the following students:

7<sup>th</sup> graders – 29      9<sup>th</sup> graders – 29      11<sup>th</sup> graders – 22

8<sup>th</sup> graders – 50      10<sup>th</sup> graders – 58      12<sup>th</sup> graders – 20

Total CHAT students - 208

### Steps to making a circle graph:

1. Turn the numbers into percentages (rounded to the nearest percent)

$$7^{\text{th}} \text{ graders} - 29 \rightarrow \frac{29}{208} = .14 = 14\%$$

$$8^{\text{th}} \text{ graders} - 50 \rightarrow \frac{50}{208} = .24 = 24\%$$

$$9^{\text{th}} \text{ graders} - 29 \rightarrow \frac{29}{208} = .14 = 14\%$$

$$10^{\text{th}} \text{ graders} - 58 \rightarrow \frac{58}{208} = .27 = 28\%^*$$

$$11^{\text{th}} \text{ graders} - 22 \rightarrow \frac{22}{208} = .11 = 11\%$$

$$12^{\text{th}} \text{ graders} - 20 \rightarrow \frac{20}{208} = .10 = 10\%$$

\*If the percents don't add up to 100%, adjust the largest number. We need to make it 29% for the 10<sup>th</sup> graders.

2. Since a circle contains  $360^\circ$ , multiply each % by 360 to find the number of degrees for each category (rounded to the nearest degree).

$$7^{\text{th}} \text{ graders} \rightarrow (14\%)(360) = 50^\circ$$

$$8^{\text{th}} \text{ graders} \rightarrow (24\%)(360) = 86^\circ$$

$$9^{\text{th}} \text{ graders} \rightarrow (14\%)(360) = 50^\circ$$

$$10^{\text{th}} \text{ graders} \rightarrow (27\%)(360) = 97^\circ *$$

$$11^{\text{th}} \text{ graders} \rightarrow (11\%)(360) = 40^\circ$$

$$12^{\text{th}} \text{ graders} \rightarrow (10\%)(360) = 36^\circ$$

\*If the degrees don't add up to  $360^\circ$  adjust the largest number. We need to make it  $98^\circ$  for the  $10^{\text{th}}$  graders.

3. Draw a circle and use a protractor to measure the correct number of degrees for each category.
4. Label each pie-shaped piece in words and percents.
5. Title the graph.

## CHAT Students

Make a pie chart for our previous example:

Miles from Church	Number of Members
less than 2 miles	22
2-5 miles	48
5-10 miles	39
over 10 miles	47

$$\text{Less than 2 miles} \rightarrow \frac{22}{156} = 14\% \rightarrow (.14)(360) = 51^\circ$$

$$\text{2-5 miles} \rightarrow \frac{48}{156} = 31\% \rightarrow (.31)(360) = 111^\circ$$

$$\text{5-10 miles} \rightarrow \frac{39}{156} = 25\% \rightarrow (.25)(360) = 90^\circ$$

$$\text{Over 10 miles} \rightarrow \frac{47}{156} = 30\% \rightarrow (.30)(360) = 108^\circ$$

Miles from Church

Solution:

Miles from Church

## How to decide which type to use:

Box-and-whisker	<ul style="list-style-type: none"> <li>• To illustrate the 5-point summary</li> <li>• To quickly compare 2 or more data sets</li> <li>• When the data set is large</li> </ul>	<ul style="list-style-type: none"> <li>• When the exact values in the data set are important</li> </ul>
Stem-and-leaf	<ul style="list-style-type: none"> <li>• To visually represent the range, mode, and data inconsistencies</li> <li>• To keep exact values of the data set visible</li> <li>• When the data set is large</li> </ul>	<ul style="list-style-type: none"> <li>• When central tendency information is to be conveyed by the representation</li> </ul>
Scatterplot	<ul style="list-style-type: none"> <li>• To illustrate the relationship between two characteristics of the data</li> </ul>	<ul style="list-style-type: none"> <li>• When the data set is large</li> </ul>
Histogram	<ul style="list-style-type: none"> <li>• To clearly illustrate large amounts of data when central tendency values are fairly apparent</li> <li>• When the data set is large</li> </ul>	<ul style="list-style-type: none"> <li>• When the exact values in the data set are important</li> <li>• When two or more sets of data are to be compared</li> </ul>
Bar graph	<ul style="list-style-type: none"> <li>• To illustrate data reported as frequency in groups</li> <li>• To compare two or more data sets</li> </ul>	<ul style="list-style-type: none"> <li>• When data is not organized by groups</li> </ul>
Line graph	<ul style="list-style-type: none"> <li>• To illustrate changes over a period of time</li> <li>• To compare two or more data sets</li> </ul>	
Pie chart	<ul style="list-style-type: none"> <li>• To display how the entire whole is separated into parts</li> <li>• When data is reported as percentages or frequencies in groups</li> </ul>	<ul style="list-style-type: none"> <li>• When two or more sets of data are to be compared</li> <li>• When there are many categories given in the data set</li> </ul>
